

The premise:

“How you Go is driven by what you Know”

In Neurotypical (no ADHD) individuals, these 2 parts of the brain work together seamlessly.

The Premise

2 Functional Parts of the Brain:

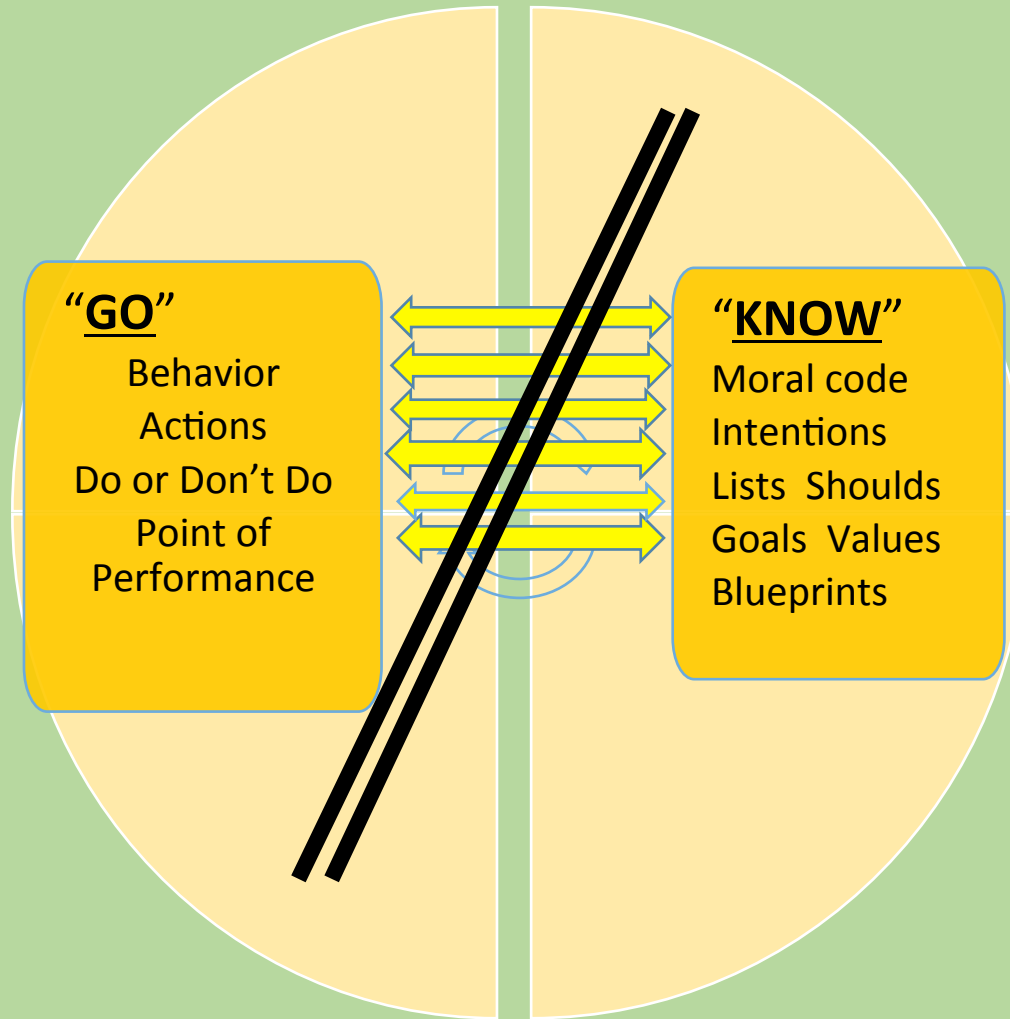

This results in behavior that reflects on individual's values and intentions.

The Problem in ADHD: The 2 parts do not communicate well

“Sleepy Neurons” in ADHD

2 sides can not connect because these neurons are “Sleepy” in ADHD. Brain can not access what it knows in order to influence the behavioral decision-making process.

If 2 sides are disconnected, Less Impulse Control, Less Self-Control
Result = Behavior no longer reflects intentions or goals.
